NeuralMatrix AccessProof — Production Readiness Report

Date: 2026-11-02 **Determination: NOT_READY Signed:** No **Nature:** internal engineering assessment. This is *not* an independent certification or accreditation.

A. Executive summary

The code implements the two-layer design correctly in every path reviewed: unauthorized chunks are removed before the model call, model context is built only from verified and attested allow-listed bytes, the answer is buffered, and release requires Layer 2 with matching authorization revisions. The full automated suite passes locally (1313 passed, 0 failed, 4 skipped).

This session fixed four defects:

• **D-01:** the API could mint its own SharePoint certificates.

• **D-02:** Gateways had no authenticated liveness.

• **D-03:** a production Guard accepted shared-secret identities and reported ready.

• **D-04:** undecryptable Microsoft credentials crashed activation checks.

The product is **not ready**. The real protected-RAG acceptance test has never passed, SharePoint Protect is (correctly) blocked pending live certification evidence, and production, AWS and the tenant were unreachable from this environment, so nothing was deployed or verified live.

B. Architecture and trust boundaries

See `docs/ACCESSPROOF_ARCHITECTURE_AUDIT.md` and `docs/ACCESSPROOF_SECURITY_THREAT_MODEL.md`.

C. Feature coverage

See `docs/ACCESSPROOF_FEATURE_MATRIX.md`. No feature is VERIFIED or PRODUCTION_CERTIFIED. Onboarding reset is NOT_IMPLEMENTED.

D. Security assessment

Authentication, authorization, provenance, revocation, cache and route controls are present and tested locally. Hardened in this change: certificate trust (D-01), production identity mode (D-03) and Gateway liveness (D-02).

E. Test results

`ACCESSPROOF_TEST_RESULTS.json`, generated from JUnit (1317 tests; 1313 passed; 4 skipped: local Ollama ×3, live SharePoint fixture ×1). Live categories (SharePoint tenant, real RAG, live revocation, production) are **BLOCKED** and not counted.

F. Vulnerabilities and defects

`docs/ACCESSPROOF_DEFECT_REGISTER.md`: D-01..D-04 fixed locally; O-01..O-09 open.

G. Deployment verification

Not performed. Production hosts were denied by the session network policy, and AWS STS rejected the container's credentials. Last reported production images (prior team, 2026-11-01): API `auth-limiter-r2-20261101`, web `onboarding-source-r6-20261101`. Not re-observed.

Deploying this change requires migrations `q1a2b3c4d5e6` and `r2b3c4d5e6f7`. Rollback is the previous images with `alembic downgrade p8c1e2f3a4b5`.

H. Supported scope

SharePoint Online list-item effective profile (**not certified**); Google Drive V1 (regression); Gateway contract `accessproof.gateway/v1`; customer-hosted Guard + Gateway on Docker Compose with one selected chatbot. OneDrive, Confluence, Slack and Salesforce are unsupported for Protect.

I. Final determination

Product readiness	**NOT_READY**
Test-workspace protection state	**Not protected** (last reported `protect_pending`)
External certification	None. Review cannot start until live evidence exists

Path to approval: `docs/ACCESSPROOF_PRODUCTION_READINESS.md`.
